Frequently Asked Questions (FAQ)

Q1: What types of materials can be conveyed pneumatically?

A1: A wide range of materials can be conveyed pneumatically, including powders, granules, pellets, and even small solids. However, the suitability of a material for pneumatic conveying depends on its properties such as particle size, density, abrasiveness, and tendency to agglomerate. Mills' handbook provides guidance on selecting the appropriate conveying method based on material characteristics.

Q2: What are the advantages of pneumatic conveying over other material handling methods?

A2: Pneumatic conveying offers several advantages, including: enclosed systems minimizing dust and spillage, ease of automation and integration into larger processes, ability to transport materials over long distances, and reduced labor costs compared to manual handling.

Q3: What are some common problems encountered in pneumatic conveying systems?

A3: Common issues include blockages caused by

material agglomeration or pipe restrictions, excessive pressure drop leading to inefficiencies, and wear and tear on system components due to abrasive materials. Mills' handbook provides detailed troubleshooting procedures for these and other common problems.

Q4: How does the handbook help with system design?

A4: The handbook provides step-by-step guidance on designing pneumatic conveying systems, including calculations for pressure drop, air velocity, and pipe sizing. It also covers the selection of appropriate equipment and the optimization of system parameters for efficiency and safety.
